

Estimated TDS and pH Values by Area — Faisalabad, Punjab, Pakistan

Important: All locality-level values below are screening estimates for untreated groundwater/tube-well water; they are not certified readings for a specific household, street, or water-supply source. Actual water can differ substantially within each area.

Area	Estimated TDS (mg/L / ppm)	Estimated pH	Practical interpretation
Ghulam Muhammad Abad	900–2,000	7.5–8.4	Often high TDS; mildly alkaline likely
Rasool Nagar	800–1,800	7.4–8.3	Variable urban groundwater
Jinnah Colony	700–1,600	7.4–8.3	Moderate to high TDS possible
Gulberg	700–1,600	7.4–8.3	Moderate to high TDS possible
People's Colony No. 1	600–1,400	7.3–8.2	Variable; supply source matters strongly
People's Colony No. 2	700–1,600	7.3–8.3	Variable; bore water may be higher
Madina Town	600–1,400	7.3–8.2	Moderate range; source-dependent
Susan Road	700–1,700	7.4–8.4	Urban/roadside bore water can be elevated
Samanabad	800–1,800	7.4–8.4	Moderate to high TDS possible
D-Type Colony	800–1,800	7.4–8.4	Moderate to high TDS possible
Nisar Colony	900–2,000	7.5–8.5	Higher risk of saline groundwater
Sir Syed Town	800–1,800	7.4–8.4	Moderate to high TDS possible
Allama Iqbal Colony	900–2,000	7.5–8.5	Higher-priority area for testing
Batala Colony	1,000–2,300	7.5–8.6	High-risk; industrial/urban influence possible
Warispura	1,000–2,500	7.5–8.6	High-risk; test bore water
Ayub Colony	800–1,800	7.4–8.4	Moderate to high TDS possible
Nishatabad	1,200–3,000	7.6–8.7	Higher risk; industrial influence may affect groundwater
Millat Town	900–2,000	7.5–8.5	High variation between wells
Mansoorabad	900–2,000	7.5–8.5	Moderate to high TDS possible
Nigehban Pura	1,000–2,500	7.5–8.6	Higher-risk groundwater estimate
Sargodha Road	1,000–2,500	7.5–8.6	High variability; roadside/industrial influence
Canal Road	500–1,300	7.2–8.1	Canal recharge may lower TDS in some wells
Factory Area	1,500–3,500+	7.6–8.8	Very high-risk; do not assume bore water is drinkable
Jaranwala Road	900–2,200	7.5–8.6	Variable; outer industrial stretches can be worse
Chak 224 RB	700–1,800	7.4–8.4	Agricultural-area variation; test local source
Lathianwala / Chak 194–200 RB	700–1,800	7.4–8.4	Variable rural groundwater
Chak 7 JB	800–2,000	7.5–8.5	Variable, often moderately saline
Sadhar	800–2,000	7.5–8.5	Rural/peri-urban groundwater can be high
Dijkot	900–2,200	7.5–8.6	Moderate to high likely
Chak Jhumra	2,500–7,500+	7.7–8.8	Very high TDS risk; strongly brackish conditions reported
Jaranwala City	900–2,200	7.5–8.6	Moderate to high likely; source matters
Samundri City	1,000–2,500	7.5–8.6	Higher risk; salts and TDS can be elevated
Tandlianwala City	1,000–2,500	7.5–8.6	Higher risk; test before relying on groundwater
Mamukanjan	900–2,200	7.5–8.5	Moderate to high likely

How to interpret the results

pH: pH describes acidity or alkalinity. A pH of 7 is neutral; below 7 is acidic and above 7 is alkaline.

Typical guideline: Drinking-water guidance commonly uses pH 6.5–8.5 as an acceptable operational/aesthetic range. pH itself does not determine whether water is microbiologically or chemically safe.

Faisalabad evidence: Published sources report Faisalabad pH ranges around 6.8–8.2 in one groundwater study, a mean of 8.55 in another dataset, and division-level annual values around 7.9–8.6. The estimates in this report were therefore set mainly in the neutral-to-alkaline range.

TDS bands: Below 500 ppm: generally acceptable from a TDS perspective. 500–1,000 ppm: test full chemistry and microbiology. Above 1,000 ppm: high; avoid relying on untreated water for regular drinking. Above 2,000 ppm: very high/brackish; appropriate treatment is needed.

Do not rely on pH/TDS alone: Test *E. coli*/coliform bacteria, arsenic, fluoride, nitrate, hardness, chloride, sulphate, iron, and relevant heavy metals—especially for bore/tube-well water near drains, factories, or wastewater-affected areas.

Source basis and limitation: Public Faisalabad groundwater studies and regional water-quality sources consulted on 26 September 2026. Reported city/division pH evidence includes a Faisalabad study reporting pH 6.8–8.2, a separate dataset reporting a mean pH of 8.55, and division-level monitoring reporting 7.9–8.6. No verified public source was found that measured current pH separately in every named locality; individual-area pH figures above are reasoned estimates derived from the broader evidence and must be confirmed by on-site testing.
